

## Team Project – Deliverable 3

### Project Management Plan

#### Objective

The purpose of the third deliverable is to **refine system details** in terms of components, user interaction, and overall system functionality.

In addition this deliverable requires teams to research, compile, and present more findings in terms of industry accepted approaches to their system and potential technologies that might be used.

At this point the team is not concerned about the **final** physical system form but should work toward determining **potential system software, hardware, etc.**

Finally, the team will work to map out the **user stories, features, functions, etc. into sprint iterations**. The Team must have a complete Roadmap set in their KanBan for the entire project. (January through April are tentative dates.)

Teams will also start development in their **Wiki**.

## Reminder

If teams have **targeted questions** on any segment, please ask. If the questions require discussion, the instructor will ask the team or a designated team member for a meeting.

**Please note: Content is important for this deliverable, but so is formatting and presentation.**

## Deliverables

As before depending on the type of application or system. **Teams should coordinate with the instructor to determine specific project needs.**

The following components should be in every team's deliverable as separate sections:

### Cover Page

The cover page should include the Deliverable#, Date, Team Name, and Team Members (with classIDs)

### Table of Contents

The deliverable needs a table of contents with page numbers.

### 1.0 Final Project Overview

The team should finalize the project overview after meeting and discussing their project understanding with the client.

**Duplicate this section in the PDF and in the Wiki.**

### 2.0 Research Findings

Here the team presents all its research to date into the technologies, industry best practices, frameworks, and other items that will inform the overall system.

**This section should be very developed as opposed to previous deliverables.**

Do make sure to cite resources using APA 7<sup>th</sup> ed.

### 3.0 Final System Component Discussion

This section covers what the team envisions as the various components along with potential system challenges the team anticipates.

This section should include any additional components and/or revisions. Make sure to note the **revisions and additional components in a separate subsection**.

**Duplicate this section in the PDF and in the Wiki.**

### 4.0 Revised and/or New Stories

The team needs to continue develop the functions and features into more actionable content. Teams should include a sub-section with user stories and a sub-section with feature/function discussions.

**These should appear in the KanBan as tasks.**

### 5.0 Diagrams, Schematics, etc.

This section will include any revisions or new visual representations of the system, processes, users, etc. that the team has created. **Revised diagrams should be marked as such.**

**If teams have not yet completed an Activity Diagram or a Business Process Diagram, it needs to be done in this deliverable.**

**Teams will have different deliverables in this section.**

Teams should include readable images of their diagrams and schematics in the report, as well as their original Visio files uploaded into an MS Teams folder named **Diagrams/P3**. Note the folder name in the report and use **distinct iteration sub-folders for all schematics from this point forward**.

### 6.0 Meeting Logs and Reports

Teams should include all logs and other associated items in this section. These can be images in the deliverable. However, there should also be a folder in the MS Teams folder named **Meetings** that contains all the original meeting information in whichever file format the team is using.

## 7.0 Team Member Contribution Table

Include a table that lists what each team member contributed to this deliverable.

## GitHub Project Area

**This deliverable will require more work in the GitHub area than before.**

## **KanBan**

All assignments completed, in progress, and planned should be present and assigned to team members.

**This includes a complete Roadmap, Priority Board, etc.**

**Teams should start to indicate what user stories will be completed in future iterations as well. This can be accomplished via a Feature List tab.**

## **Wiki**

The wiki should include pages on the project overview, system component discussion, and perhaps preliminary documentation.

Other items are acceptable as warranted by the team.

## Submission

Team leaders—or the designated team member—should turn in the PDF file into the eLearning Dropbox by the due date and time. Only one file should be submitted per team.

Name the file:

**TeamName-PD3.pdf**
